

# Package ‘BKP’

July 23, 2025

**Title** Beta and Dirichlet Kernel Processes for Binomial and Multinomial Modeling

**Version** 0.1.0

**Author** Jiangyan Zhao [cre, aut],  
Kunhai Qing [aut],  
Jin Xu [aut]

**Maintainer** Jiangyan Zhao <zhaojy2017@126.com>

**Description** Provides methods for nonparametric modeling of binomial and multinomial success probabilities via the Beta Kernel Process and its extension, the Dirichlet Kernel Process.  
Supports model fitting, predictive inference with uncertainty quantification, posterior simulation, and visualization in one- and two-dimensional input spaces.  
The package implements multiple kernel functions (Gaussian, Matern 5/2, and Matern 3/2), and performs hyperparameter optimization using multi-start gradient-based search.  
Applications include spatial statistics, probabilistic classification, and Bayesian experimental design.  
For more details, see MacKenzie, Trafalis, and Barker (2014) <[doi:10.1002/sam.11241](https://doi.org/10.1002/sam.11241)>.

## Description

The **BKP** package provides tools for nonparametric modeling of binary, binomial, or multinomial response data using the Beta Kernel Process (BKP) and its extension, the Dirichlet Kernel Process (DKP). These methods estimate latent probability surfaces through localized kernel smoothing under a Bayesian framework.

The package includes functionality for model fitting, probabilistic prediction with uncertainty quantification, posterior simulation, and visualization in both one- and two-dimensional input spaces. It also supports hyperparameter tuning and flexible prior specification.

## Main Functions

Core functionality is organized into the following groups:

**fit.BKP, fit.DKP** Fit a BKP or DKP model to (multi)binomial response data.

**predict.BKP, predict.DKP** Perform posterior predictive inference at new input locations, including predictive means, variances, and credible intervals. Classification labels are returned automatically when observations represent single trials (i.e., binary outcomes).

**simulate.BKP, simulate.DKP** Draw simulated responses from the posterior predictive distribution of a fitted model.

**plot.BKP, plot.DKP** Visualize model predictions and uncertainty bands in 1D and 2D input spaces.

**summary.BKP, summary.DKP, print.BKP, print.DKP** Summarize or print details of a fitted BKP or DKP model.

fit.BKP

*Fit a Beta Kernel Process (BKP) Model*

## Description

Fits a BKP model to binomial or binary response data via local kernel smoothing. The model constructs a flexible latent probability surface by updating Beta priors using kernel-weighted observations.

## Usage

```
fit.BKP(
  X,
  y,
  m,
  Xbounds = NULL,
  prior = c("noninformative", "fixed", "adaptive"),
  r0 = 2,
  p0 = 0.5,
  kernel = c("gaussian", "matern52", "matern32"),
  loss = c("brier", "log_loss"),
  n_multi_start = NULL
)
```

## Arguments

X	A numeric input matrix of size $n \times d$ , where each row represents a covariate vector.
y	A numeric vector of observed successes (length $n$ ).
m	A numeric vector of total binomial trials (length $n$ ), corresponding to each y.
Xbounds	Optional $d \times 2$ matrix specifying the lower and upper bounds of each input dimension. Used to normalize inputs to $[0, 1]^d$ . If Xbounds is NULL, the input is assumed to have already been normalized, and the default bounds are set to $[0, 1]^d$ .

<code>prior</code>	Type of prior to use. One of "noninformative", "fixed", or "adaptive".
<code>r0</code>	Global prior precision (only used when <code>prior</code> = "fixed" or "adaptive").
<code>p0</code>	Global prior mean (only used when <code>prior</code> = "fixed").
<code>kernel</code>	Kernel function for local weighting. Choose from "gaussian", "matern52", or "matern32".
<code>loss</code>	Loss function for kernel hyperparameter tuning. One of "brier" (default) or "log_loss".
<code>n_multi_start</code>	Number of random initializations for multi-start optimization. Default is $10 \times d$ .

### Value

A list of class "BKP" containing the fitted BKP model, with the following elements:

- `theta_opt` Optimized kernel hyperparameters (lengthscales).
- `kernel` Kernel function used, as a string.
- `loss` Loss function used for hyperparameter tuning.
- `loss_min` Minimum loss value achieved during optimization.
- `X` Original (unnormalized) input matrix of size  $n \times d$ .
- `Xnorm` Normalized input matrix scaled to  $[0, 1]^d$ .
- `Xbounds` Matrix specifying normalization bounds for each input dimension.
- `y` Observed success counts.
- `m` Observed binomial trial counts.
- `prior` Type of prior used.
- `r0` Prior precision parameter.
- `p0` Prior mean (for fixed priors).
- `alpha0` Prior shape parameter  $\alpha_0(\mathbf{x})$ , either a scalar or vector.
- `beta0` Prior shape parameter  $\beta_0(\mathbf{x})$ , either a scalar or vector.
- `alpha_n` Posterior shape parameter  $\alpha_n(\mathbf{x})$ .
- `beta_n` Posterior shape parameter  $\beta_n(\mathbf{x})$ .

### Examples

```
#----- 1D Example -----
set.seed(123)

# Define true success probability function
true_pi_fun <- function(x) {
  (1 + exp(-x^2) * cos(10 * (1 - exp(-x)) / (1 + exp(-x)))) / 2
```

```

}

n <- 30
Xbounds <- matrix(c(-2,2), nrow=1)
X <- tgp::lhs(n = n, rect = Xbounds)
true_pi <- true_pi_fun(X)
m <- sample(100, n, replace = TRUE)
y <- rbinom(n, size = m, prob = true_pi)

# Fit BKP model
model1 <- fit.BKP(X, y, m, Xbounds=Xbounds)
print(model1)

#----- 2D Example -----
set.seed(123)

# Define 2D latent function and probability transformation
true_pi_fun <- function(X) {
  if(is.null(nrow(X))) X <- matrix(X, nrow=1)
  m <- 8.6928
  s <- 2.4269
  x1 <- 4*X[,1]- 2
  x2 <- 4*X[,2]- 2
  a <- 1 + (x1 + x2 + 1)^2 *
    (19- 14*x1 + 3*x1^2- 14*x2 + 6*x1*x2 + 3*x2^2)
  b <- 30 + (2*x1- 3*x2)^2 *
    (18- 32*x1 + 12*x1^2 + 48*x2- 36*x1*x2 + 27*x2^2)
  f <- log(a*b)
  f <- (f- m)/s
  return(pnorm(f)) # Transform to probability
}

n <- 100
Xbounds <- matrix(c(0, 0, 1, 1), nrow = 2)
X <- tgp::lhs(n = n, rect = Xbounds)
true_pi <- true_pi_fun(X)
m <- sample(100, n, replace = TRUE)
y <- rbinom(n, size = m, prob = true_pi)

# Fit BKP model
model2 <- fit.BKP(X, y, m, Xbounds=Xbounds)
print(model2)

```

## Description

Fits a DKP model for multinomial response data by locally smoothing observed counts to estimate latent Dirichlet parameters.

## Usage

```
fit.DKP(
  X,
  Y,
  Xbounds = NULL,
  prior = c("noninformative", "fixed", "adaptive"),
  r0 = 2,
  p0 = NULL,
  kernel = c("gaussian", "matern52", "matern32"),
  loss = c("brier", "log_loss"),
  n_multi_start = NULL
)
```

## Arguments

X	A numeric input matrix of size $n \times d$ , where each row represents a covariate vector.
Y	Matrix of observed multinomial counts, with dimension $n \times q$ .
Xbounds	Optional $d \times 2$ matrix specifying the lower and upper bounds of each input dimension. Used to normalize inputs to $[0, 1]^d$ . If Xbounds is NULL, the input is assumed to have already been normalized, and the default bounds are set to $[0, 1]^d$ .
prior	Type of prior to use. One of "noninformative", "fixed", or "adaptive".
r0	Global prior precision (only used when prior = "fixed" or "adaptive").
p0	Global prior mean vector (only used when prior = "fixed"). Must be of length $q$ .
kernel	Kernel function for local weighting. Choose from "gaussian", "matern52", or "matern32".
loss	Loss function for kernel hyperparameter tuning. One of "brier" (default) or "log_loss".
n_multi_start	Number of random initializations for multi-start optimization. Default is $10 \times d$ .

## Value

A list of class "DKP" representing the fitted DKP model, with the following components:

- `theta_opt` Optimized kernel hyperparameters (lengthscales).
- `kernel` Kernel function used, as a string.
- `loss` Loss function used for hyperparameter tuning.
- `loss_min` Minimum loss value achieved during optimization.

`X` Original (unnormalized) input matrix of size  $n \times d$ .  
`Xnorm` Normalized input matrix scaled to  $[0, 1]^d$ .  
`Xbounds` Matrix specifying normalization bounds for each input dimension.  
`Y` Observed multinomial counts of size  $n \times q$ .  
`prior` Type of prior used.  
`r0` Prior precision parameter.  
`p0` Prior mean (for fixed priors).  
`alpha0` Prior Dirichlet parameters at each input location (scalar or matrix).  
`alpha_n` Posterior Dirichlet parameters after kernel smoothing.

## Examples

```

#----- 1D Example -----
set.seed(123)

# Define true class probability function (3-class)
true_pi_fun <- function(X) {
  p <- (1 + exp(-X^2) * cos(10 * (1 - exp(-X)) / (1 + exp(-X)))) / 2
  return(matrix(c(p/2, p/2, 1 - p), nrow = length(p)))
}

n <- 30
Xbounds <- matrix(c(-2, 2), nrow = 1)
X <- tgp::lhs(n = n, rect = Xbounds)
true_pi <- true_pi_fun(X)
m <- sample(100, n, replace = TRUE)

# Generate multinomial responses
Y <- t(sapply(1:n, function(i) rmultinom(1, size = m[i], prob = true_pi[i, ])))

# Fit DKP model
model1 <- fit.DKP(X, Y, Xbounds = Xbounds)
print(model1)

#----- 2D Example -----
set.seed(123)

# Define latent function and transform to 3-class probabilities
true_pi_fun <- function(X) {
  if (is.null(nrow(X))) X <- matrix(X, nrow = 1)
  m <- 8.6928; s <- 2.4269
  x1 <- 4 * X[,1] - 2
  x2 <- 4 * X[,2] - 2
  p <- (1 + exp(-(x1^2 + x2^2) * (1 - exp(-(x1^2 + x2^2)) / (1 + exp(-(x1^2 + x2^2))))) / 2
  return(matrix(c(p/2, p/2, 1 - p), nrow = length(p)))
}

```

```

x2 <- 4 * X[,2] - 2
a <- 1 + (x1 + x2 + 1)^2 *
  (19 - 14*x1 + 3*x1^2 - 14*x2 + 6*x1*x2 + 3*x2^2)
b <- 30 + (2*x1 - 3*x2)^2 *
  (18 - 32*x1 + 12*x1^2 + 48*x2 - 36*x1*x2 + 27*x2^2)
f <- (log(a * b) - m) / s
p <- pnorm(f)
return(matrix(c(p/2, p/2, 1 - p), nrow = length(p)))
}

n <- 100
Xbounds <- matrix(c(0, 0, 1, 1), nrow = 2)
X <- tgp::lhs(n = n, rect = Xbounds)
true_pi <- true_pi_fun(X)
m <- sample(100, n, replace = TRUE)

# Generate multinomial responses
Y <- t(sapply(1:n, function(i) rmultinom(1, size = m[i], prob = true_pi[i, ])))

# Fit DKP model
model2 <- fit.DKP(X, Y, Xbounds = Xbounds)
print(model2)

```

**get\_prior***Construct Prior Parameters for the BKP Model***Description**

Computes the prior Beta distribution parameters alpha0 and beta0 at each input location, based on the chosen prior specification. Supports noninformative, fixed, and data-adaptive prior strategies.

**Usage**

```
get_prior(
  prior = c("noninformative", "fixed", "adaptive"),
  r0 = 2,
  p0 = 0.5,
  y = NULL,
  m = NULL,
  K = NULL
)
```

**Arguments**

- |              |   |
|--------------|---|
| <b>prior</b> | Character string specifying the type of prior to use. One of "noninformative", "fixed", or "adaptive".      |
| <b>r0</b>    | Positive scalar indicating the global precision parameter. Used when <b>prior</b> is "fixed" or "adaptive". |

$p_0$	Prior mean for the success probability (in (0,1)). Used only when <code>prior = "fixed"</code> .
<code>y</code>	Numeric vector of observed successes, of length <code>n</code> .
<code>m</code>	Numeric vector of total binomial trials, of length <code>n</code> .
<code>K</code>	A precomputed kernel matrix of size $n \times n$ , typically obtained from <a href="#">kernel_matrix</a> .

## Details

- For `prior = "noninformative"`, all prior parameters are set to 1 (noninformative prior).
- For `prior = "fixed"`, all locations share the same Beta prior:  $\text{Beta}(r_0 * p_0, r_0 * (1 - p_0))$ .
- For `prior = "adaptive"`, the prior mean at each location is computed by kernel smoothing the observed proportions  $y/m$ , and precision  $r_0$  is distributed accordingly.

## Value

A list with two numeric vectors:

`alpha0` Prior alpha parameters of the Beta distribution, length `n`.

`beta0` Prior beta parameters of the Beta distribution, length `n`.

## See Also

[get\\_prior\\_dkp](#), [fit.BKP](#), [predict.BKP](#), [kernel\\_matrix](#)

## Examples

```
# Simulated data
set.seed(123)
n <- 10
X <- matrix(runif(n * 2), ncol = 2)
y <- rbinom(n, size = 5, prob = 0.6)
m <- rep(5, n)

# Example kernel matrix (Gaussian)
K <- kernel_matrix(X)

# Construct adaptive prior
prior <- get_prior(prior = "adaptive", r0 = 2, y = y, m = m, K = K)
```

**get\_prior\_dkp***Construct Prior Parameters for the DKP Model***Description**

Computes prior Dirichlet distribution parameters  $\alpha_0$  at each input location for the Dirichlet Kernel Process model, based on the specified prior type: noninformative, fixed, or adaptive.

**Usage**

```
get_prior_dkp(
  prior = c("noninformative", "fixed", "adaptive"),
  r0 = 2,
  p0 = NULL,
  Y = NULL,
  K = NULL
)
```

**Arguments**

<code>prior</code>	Character string specifying the type of prior to use. One of "noninformative", "fixed", or "adaptive".
<code>r0</code>	Positive scalar indicating the global precision parameter. Used when <code>prior</code> is "fixed" or "adaptive".
<code>p0</code>	Numeric vector specifying the global prior mean for each class (must sum to 1). Only used when <code>prior</code> = "fixed". Should be of length equal to the number of classes.
<code>Y</code>	Numeric matrix of observed class counts of size $n \times q$ , where $n$ is the number of observations and $q$ the number of classes.
<code>K</code>	A precomputed kernel matrix of size $n \times n$ , typically obtained from <a href="#">kernel_matrix</a> .

**Details**

- When `prior` = "noninformative", all entries in  $\alpha_0$  are set to 1 (flat Dirichlet).
- When `prior` = "fixed", all rows of  $\alpha_0$  are set to  $r0 * p0$ .
- When `prior` = "adaptive", each row of  $\alpha_0$  is computed by kernel-weighted smoothing of the observed relative frequencies in `Y`, scaled by `r0`.

**Value**

A list containing:

`alpha0` A numeric matrix of prior Dirichlet parameters at each input location; dimension  $n \times q$ .

**See Also**

[get\\_prior](#), [fit.DKP](#), [predict.DKP](#), [kernel\\_matrix](#)

## Examples

```
# Simulated multi-class data
set.seed(123)
n <- 15          # number of training points
q <- 3           # number of classes
X <- matrix(runif(n * 2), ncol = 2)

# Simulate class probabilities and draw multinomial counts
true_pi <- t(apply(X, 1, function(x) {
  raw <- c(
    exp(-sum((x - 0.2)^2)),
    exp(-sum((x - 0.5)^2)),
    exp(-sum((x - 0.8)^2))
  )
  raw / sum(raw)
})))
m <- sample(10:20, n, replace = TRUE)
Y <- t(sapply(1:n, function(i) rmultinom(1, size = m[i], prob = true_pi[i, ])))

# Compute kernel matrix (Gaussian)
K <- kernel_matrix(X, theta = rep(0.2, 2), kernel = "gaussian")

# Construct adaptive prior
prior_dkp <- get_prior_dkp(prior = "adaptive", r0 = 2, Y = Y, K = K)
```

kernel\_matrix

*Compute Kernel Matrix Between Input Locations*

## Description

Computes the kernel matrix between two sets of input locations using a specified kernel function. Supports both isotropic and anisotropic lengthscales. Available kernels include the Gaussian, Matérn 5/2, and Matérn 3/2.

## Usage

```
kernel_matrix(
  X,
  Xprime = NULL,
  theta = 0.1,
  kernel = c("gaussian", "matern52", "matern32"),
  anisotropic = TRUE
)
```

## Arguments

X	A numeric matrix (or vector) of input locations with shape $n \times d$ .
---	---

Xprime	An optional numeric matrix of input locations with shape $m \times d$ . If NULL (default), it is set to X, resulting in a symmetric matrix.
theta	A positive numeric value or vector specifying the kernel lengthscale(s). If a scalar, the same lengthscale is applied to all input dimensions. If a vector, it must be of length d, corresponding to anisotropic scaling.
kernel	A character string specifying the kernel function. Must be one of "gaussian", "matern32", or "matern52".
anisotropic	Logical. If TRUE (default), theta is interpreted as a vector of per-dimension lengthscales. If FALSE, theta is treated as a scalar.

## Details

Let  $\mathbf{x}$  and  $\mathbf{x}'$  denote two input points. The scaled distance is defined as

$$r = \left\| \frac{\mathbf{x} - \mathbf{x}'}{\theta} \right\|_2.$$

The available kernels are defined as:

- **Gaussian:**

$$k(\mathbf{x}, \mathbf{x}') = \exp(-r^2)$$

- **Matérn 5/2:**

$$k(\mathbf{x}, \mathbf{x}') = \left( 1 + \sqrt{5}r + \frac{5}{3}r^2 \right) \exp(-\sqrt{5}r)$$

- **Matérn 3/2:**

$$k(\mathbf{x}, \mathbf{x}') = \left( 1 + \sqrt{3}r \right) \exp(-\sqrt{3}r)$$

The function performs consistency checks on input dimensions and automatically broadcasts theta when it is a scalar.

## Value

A numeric matrix of size  $n \times m$ , where each element  $K_{ij}$  gives the kernel similarity between input  $X_i$  and  $X'_j$ .

## References

Rasmussen, C. E., & Williams, C. K. I. (2006). *Gaussian Processes for Machine Learning*. MIT Press.

## Examples

```
# Basic usage with default Xprime = X
X <- matrix(runif(20), ncol = 2)
K1 <- kernel_matrix(X, theta = 0.2, kernel = "gaussian")

# Anisotropic lengthscales with Matérn 5/2
K2 <- kernel_matrix(X, theta = c(0.1, 0.3), kernel = "matern52")
```

```
# Isotropic Matérn 3/2
K3 <- kernel_matrix(X, theta = 1, kernel = "matern32", anisotropic = FALSE)

# Use Xprime different from X
Xprime <- matrix(runif(10), ncol = 2)
K4 <- kernel_matrix(X, Xprime, theta = 0.2, kernel = "gaussian")
```

**loss\_fun***Loss Function for Fitting the BKP Model***Description**

Computes the loss used to fit the BKP model. Supports the Brier score (mean squared error) and negative log-loss (cross-entropy), under different prior specifications.

**Usage**

```
loss_fun(
  gamma,
  Xnorm,
  y,
  m,
  prior = c("noninformative", "fixed", "adaptive"),
  r0 = 2,
  p0 = 0.5,
  loss = c("brier", "log_loss"),
  kernel = c("gaussian", "matern52", "matern32")
)
```

**Arguments**

<code>gamma</code>	A numeric vector of log-transformed kernel hyperparameters.
<code>Xnorm</code>	A numeric matrix of normalized inputs (each column scaled to [0, 1]).
<code>y</code>	A numeric vector of observed successes (length <code>n</code> ).
<code>m</code>	A numeric vector of total binomial trials (length <code>n</code> ), corresponding to each <code>y</code> .
<code>prior</code>	Type of prior to use. One of "noninformative", "fixed", or "adaptive".
<code>r0</code>	Global prior precision (only used when <code>prior = "fixed"</code> or "adaptive").
<code>p0</code>	Global prior mean (only used when <code>prior = "fixed"</code> ).
<code>loss</code>	Loss function for kernel hyperparameter tuning. One of "brier" (default) or "log_loss".
<code>kernel</code>	Kernel function for local weighting. Choose from "gaussian", "matern52", or "matern32".

**Value**

A single numeric value representing the total loss (to be minimized).

**See Also**

**Examples**

```
set.seed(123)
n = 10
Xnorm = matrix(runif(2 * n), ncol = 2)
m = rep(10, n)
y = rbinom(n, size = m, prob = runif(n))
loss_fun(gamma = rep(0, 2), Xnorm = Xnorm, y = y, m = m)
```

[loss\\_fun\\_dkp](#)

*Loss Function for Fitting the DKP Model*

**Description**

Computes the loss used to fit the DKP model. Supports the Brier score (mean squared error) and negative log-loss (cross-entropy), under different prior specifications.

**Usage**

```
loss_fun_dkp(
  gamma,
  Xnorm,
  Y,
  prior = c("noninformative", "fixed", "adaptive"),
  r0 = 2,
  p0 = NULL,
  loss = c("brier", "log_loss"),
  kernel = c("gaussian", "matern52", "matern32")
)
```

**Arguments**

<code>gamma</code>	A numeric vector of log-transformed kernel hyperparameters.
<code>Xnorm</code>	A numeric matrix of normalized inputs (each column scaled to $[0, 1]$ ).
<code>Y</code>	Matrix of observed multinomial counts, with dimension $n \times q$ .
<code>prior</code>	Type of prior to use. One of "noninformative", "fixed", or "adaptive".
<code>r0</code>	Global prior precision (only used when <code>prior = "fixed"</code> or "adaptive").

p0	Global prior mean vector (only used when <code>prior = "fixed"</code> ). Must be of length $q$ .
loss	Loss function for kernel hyperparameter tuning. One of "brier" (default) or "log_loss".
kernel	Kernel function for local weighting. Choose from "gaussian", "matern52", or "matern32".

**Value**

A single numeric value representing the total loss (to be minimized).

**See Also**

[loss\\_fun](#), [fit.DKP](#), [get\\_prior\\_dkp](#), [kernel\\_matrix](#)

**Examples**

```
set.seed(123)
n = 10
Xnorm = matrix(runif(2 * n), ncol = 2)
m = rep(10, n)
y = rbinom(n, size = m, prob = runif(n))
Y = cbind(y, m-y)
loss_fun_dkp(gamma = rep(0, 2), Xnorm = Xnorm, Y = Y)
```

plot

*Plot Fitted BKP or DKP Models*

**Description**

Visualizes fitted BKP or DKP models depending on the input dimensionality. For 1-dimensional inputs, it displays predicted class probabilities with credible intervals and observed data. For 2-dimensional inputs, it generates contour plots of posterior summaries.

**Usage**

```
## S3 method for class 'BKP'
plot(x, only_mean = FALSE, ...)

## S3 method for class 'DKP'
plot(x, only_mean = FALSE, ...)
```

**Arguments**

x	An object of class "BKP" or "DKP", typically returned by <a href="#">fit.BKP</a> or <a href="#">fit.DKP</a> .
only_mean	Logical. If TRUE, only the predicted mean surface is plotted for 2D inputs (only applies to BKP models). Default is FALSE.
...	Additional arguments passed to internal plotting routines (currently unused).

## Details

The plotting behavior depends on the dimensionality of the input covariates:

- **1D inputs:**
  - For BKP, the function plots the posterior mean curve with a 95% credible band, along with the observed proportions ( $y/m$ ).
  - For DKP, the function plots one curve per class, each with a shaded credible interval and observed multinomial class frequencies.
- **2D inputs:**
  - For both models, the function produces a 2-by-2 panel of contour plots for each class (or the success class in BKP), showing:
    1. Predictive mean surface
    2. Predictive 97.5th percentile surface (upper bound of 95% credible interval)
    3. Predictive variance surface
    4. Predictive 2.5th percentile surface (lower bound of 95% credible interval)

For input dimensions greater than 2, the function will terminate with an error.

## Value

This function does not return a value. It is called for its side effects, producing plots that visualize the model predictions and uncertainty.

```

## Description

Generates posterior predictive summaries from a fitted BKP or DKP model at new input locations.

## Usage

```
## S3 method for class 'BKP'
predict(object, Xnew, CI_level = 0.05, threshold = 0.5, ...)

## S3 method for class 'DKP'
predict(object, Xnew, CI_level = 0.05, ...)
```

## Arguments

<code>object</code>	An object of class "BKP" or "DKP", typically returned by <a href="#">fit.BKP</a> or <a href="#">fit.DKP</a> .
<code>Xnew</code>	A numeric matrix (or vector) of new input locations where predictions are desired.
<code>CI_level</code>	Credible level for prediction intervals (default is <code>0.05</code> , corresponding to 95% CI).
<code>threshold</code>	Classification threshold for binary prediction based on posterior mean (used only for BKP; default is <code>0.5</code> ).
<code>...</code>	Additional arguments passed to generic predict methods (currently not used; included for S3 method consistency).

## Value

A list with the following components:

`Xnew` The new input locations.

`mean` BKP: Posterior mean of the success probability at each location. DKP: A matrix of posterior mean class probabilities (rows = inputs, columns = classes).

`variance` BKP: Posterior variance of the success probability. DKP: A matrix of posterior variances for each class.

`lower` BKP: Lower bound of the prediction interval (e.g., 2.5th percentile for 95% CI). DKP: A matrix of lower bounds for each class (e.g., 2.5th percentile).

`upper` BKP: Upper bound of the prediction interval (e.g., 97.5th percentile for 95% CI). DKP: A matrix of upper bounds for each class (e.g., 97.5th percentile).

`class` BKP: Predicted binary label (0 or 1), based on posterior mean and threshold, if `m = 1`. DKP: Predicted class label (i.e., the class with the highest posterior mean probability).

**print***Print Summary of a Fitted BKP or DKP Model*

## Description

Displays a concise summary of a fitted BKP or DKP model. The output includes key characteristics such as sample size, input dimensionality, kernel type, loss function, optimized kernel hyperparameters, and minimum loss.

## Usage

```

## S3 method for class 'BKP'
print(x, ...)

## S3 method for class 'DKP'
print(x, ...)

```

## Arguments

- `x` An object of class "BKP" (from [fit.BKP](#)) or "DKP" (from [fit.DKP](#)).
- `...` Additional arguments passed to the generic `print` method (currently not used).

## Value

Invisibly returns the input object (of class "BKP" or "DKP"). The function is called for its side effect of printing a summary to the console.

## See Also

print(model2)
```

**simulate***Simulate from a Fitted BKP or DKP Model***Description**

Generates random samples from the posterior predictive distribution of a fitted BKP or DKP model at new input locations.

For BKP models, posterior samples are drawn from Beta distributions representing success probabilities, with optional binary class labels determined by a threshold.

For DKP models, posterior samples are drawn from Dirichlet distributions representing class probabilities, with optional class labels determined by the maximum a posteriori (MAP) rule if training responses are one-hot encoded.

**Usage**

```
## S3 method for class 'BKP'
simulate(object, Xnew, n_sim = 1, threshold = NULL, seed = NULL, ...)

## S3 method for class 'DKP'
simulate(object, Xnew, n_sim = 1, seed = NULL, ...)
```

**Arguments**

<code>object</code>	An object of class "BKP" or "DKP", typically returned by <code>fit.BKP</code> or <code>fit.DKP</code> .
<code>Xnew</code>	A numeric matrix or vector of new input locations for simulation.
<code>n_sim</code>	Number of posterior samples to generate (default = 1).
<code>threshold</code>	Classification threshold for binary output (only used for BKP). If specified, the output will include binary class labels with values above the threshold classified as 1 (default is NULL).
<code>seed</code>	Optional integer seed for reproducibility.
<code>...</code>	Additional arguments (currently unused).

## Value

A list with the following components:

- sims** For **BKP**: A numeric matrix of dimension  $\text{nrow}(X_{\text{new}}) \times n_{\text{sim}}$ , containing simulated success probabilities.
- For **DKP**: A numeric array of dimension  $n_{\text{sim}} \times q \times \text{nrow}(X_{\text{new}})$ , containing simulated class probabilities from Dirichlet posteriors, where  $q$  is the number of classes.
- mean** For **BKP**: A numeric vector of posterior mean success probabilities at each  $X_{\text{new}}$ .
- For **DKP**: A numeric matrix of dimension  $\text{nrow}(X_{\text{new}}) \times q$ , containing posterior mean class probabilities.
- class** For **BKP**: A binary matrix of dimension  $\text{nrow}(X_{\text{new}}) \times n_{\text{sim}}$  indicating simulated class labels (0/1), returned if threshold is specified.
- For **DKP**: A numeric matrix of dimension  $\text{nrow}(X_{\text{new}}) \times n_{\text{sim}}$  containing MAP-predicted class labels, returned only when training data is single-label (i.e., each row of  $Y$  sums to 1).

```

**summary***Summary of a Fitted BKP or DKP Model***Description**

Provides a summary of a fitted Beta Kernel Process (BKP) or Dirichlet Kernel Process (DKP) model. Currently, this function acts as a wrapper for [print.BKP](#) or [print.DKP](#), delivering a concise overview of key model characteristics and fitting results.

**Usage**

```

## S3 method for class 'BKP'
summary(object, ...)

## S3 method for class 'DKP'
summary(object, ...)

```

**Arguments**

- |        |  |
|--------|--|
| object | An object of class "BKP" (from <a href="#">fit.BKP</a> ) or "DKP" (from <a href="#">fit.DKP</a> ). |
| ...    | Additional arguments passed to the generic <code>summary</code> method (currently not used).       |

**Value**

Invisibly returns the input object (of class "BKP" or "DKP"). Called for side effects: prints a concise summary of the fitted model.
